RIKEN Arabidopais full length cDNA clones (RAFLs) sequenced by the SSP consortium (Salk/Stanford/PGEC).";
Submitted (SEP-2001) to the EMBL/GenBank/DDBJ databases.
1- TISSUE SPECIFICITY: FOUND IN SPOROPHYTIC AND GAMETOPHYTIC CELL TYPES IN THE ANTHER, ONLY IN MALE FERTILE PLANTS.
-- DEVELOPMENTAL STAGE: EXPRESSED IN MALE GAMETOGENESIS, DURING MICROSPORE DEVELOPMENT. HIGHER EXPRESSION IS FOUND DURING MICROSPORE MITOSIS WITH A DRAMATIC DECLINE DURING POLLEN
                                                                                                                                                                                                                                             Roberts M.R., Foster G.D., Blundell R.P., Robinson S.W., Kumar A., Draper J., Scott R.;

Isold-O9WV48-5; Sequence=VSP_006076, VSP_006077;
TISSUE SPECTRICITY: Expressed only in brain (neuropil of cortex, CA1 region hippocampus and molecular layer of cerebellum.)
EVELOPMENTAL STAGE: Expression increases from low levels at birth to high levels at 3-4 weeks before dropping slightly in adulthood. Expressed in the cortex and the molecular layer of the cerebellum at postnatal day 7. Isoform 2 expression does not change during developmment of both cortex and cerebellum. Isoform 4 expression decreases significantly during development of cortex but not
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sheng M., Kim E.;

The postsynaptic manages that interconnects receptors of the postsynaptic membrane including NMDA-type and metabotropic glutamate receptors, and the actin-based cytoskeleton. May play a role in the structural and functional organization of the dendritic spine and synaptic junction. Overexpression promotes maturation of dendritic spines and the enlargament of spine heads via its ability to recruit Homer to postsynaptic sites, and enhances presynaptic function.
                                                                                                                 INTERACTION WITH HOMER-1, AND SUBCELLULAR LOCATION.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                               This invention describes a novel polypeptide sharing one or more homologous amino acid domains with the legless (1gs) protein, a downstream component of the Wnt/Wingless (Wnt/Wg) signaling pathway involved in the formation and maintenance of spatial arrangements and proliferation of tissues during development, and in the formation and growth of many human tumours. The products of the invention have cytostatic activity and can be used to treat cellular disorders, blood disorders and cancers caused by over-stimulation of the Wnt pathway, where the cancerous condition is colon, breast, head and neck, brain, thyroid, medulloblastoma or skin cancer. The product could also be used to promote tissue regeneration and repair. This sequence represents the disclosure of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human; cytokine; cell proliferation; cell differentiation; growth factor inhibin; cytokine; cell proliferation; tissue growth; immunomodulator; activin; inhibin; chemctaris; chemckinesis; thrombolysis; oncogenesis; proliferation; metastasis; cancer; tumour; haematopoietic disorder; myeloid cell disorder; lymphoid cell disorder; asthma; arthritis; atherosclerosis; coronary heart disease; arterial ischaemia; bone disorder; osteoporosis; vascular growth disorder; cepeneration; wound healing; infection; immune disorder; antiastentic; drug screening; gene therapy; antiniflammatory; antiasthmatic; antiarthritic; haemostatic; antiarteriosclerotic; cytostatic; osteopathic; vascuropic; cardiant; virucide; antibacterial;

Sequences ABB10981-ABB12330 represent 1350 novel human polypeptides, and sequences ABA00225-ABA09574 represent nucleic acids encoding them. The sequences ABA00225-ABA09574 represent nucleic acids encoding them. The invention also relates to vectors and recombinant host cells comprising a nucleotide of the invention, methods of producing the novel polypeptides. Or the invention, atthough novel, many of the nucleotides of the invention although novel, many of the polypeptides of the invention although novel, many of the polypeptides of the invention have homology to known proteins, thereby giving an insight into their probable bological activities, and hence potential therapeutic applications. The polypeptides of the invention activities, including officer activity; and hence there activities including officer activities, and hence them activities; stem cell growth activity; inmunomodulatory activity; activit, tissue growth activity; immunomodulatory activities; receptor or linhibin-related activities; chemotactic or chemokinetic activities; haemostatic, thrombolytic activities; receptor or ligand activities; or may be involved in oncogenesis, cancer cell proliferation or metastasis.

Conditions, e.g., by protein or gene therapy. Such conditions include conditions, e.g., by protein or gene therapy. Such conditions and unclearing medical streaming, bone disorders (e.g., myeloid or lymphoid cell or proliferative retinopathy, atherosclerosis, coronary heart disease, arterial ischaemia, bone disorders (e.g., osteoporosis), and abnormal repair (or nucleic acids encoding them) may be used to promote wound healing (e.g., of burns, incisions and ulcers), while those with healing (e.g., of burns, incisions and ulcers), while those with complete stem cells in culture to give rise to neuroepithelial cells and pundal incidents and benefice and benefice to be promote cell growth. For example, such polypeptides my be used to browner describered benefices and pulpapelides but gament pulpapelides and pulpapelides but gament and 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               autoimmune disease or accidental damage. The polypeptides and nucleotid may also be used in the diagnosis of the above conditions, and in drug screening techniques. The present sequence represents a novel human polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                        Human proteins and DNA encoding sequences useful for preventing, treating or ameliorating a medical condition in a mammalian subject
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ó

* beta-catenin nuclear localised protein for diagnosis and treatment diseases associated with nuclear localisation of beta-catenin e.g.
                                                                                      nuclear localisation of beta-catenin e.g. cancer, including gene therapy. The present sequence represents the amino acid sequence of mouse beta-catenin nuclear localised protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a beta-catenin nuclear localised protein and DNA encoding the protein. The protein and encoding DNA are applicable in diagnosis and treatment of diseases associated with nuclear localisation of beta-catenin e.g. cancer, including gene therapy. The present sequence represents the amino acid sequence human beta-catenin nuclear localised protein #2.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                             The invention relates to a beta-catenin nuclear localised protein and DNA encoding the protein. The protein and encoding DNA are applicable in diagnosis and treatment of diseases associated with nuclear localisation of beta-catenin e.g. cancer, including gene therapy. The present sequence represents the amino acid sequence of mouse beta-catenin nuclear localised protein #2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This invention describes a novel polypeptide sharing one or more homologous amino acid domains with the legless (49s) protein, a downstream component of the Wilfyless (WilfyMg) signaling pathway involved in the formation and maintenance of spatial arrangements and proliferation of tissues during development, and in the formation and growth of many human tumours. The products of the invention have cytostatic activity and can be used to treat cellular disorders, blood disorders and cancers caused by over-stimulation of the Wint pathway, where the cancerous condition is colon, breast, head and neck, brain, thyroid, medulloblastoma or skin cancer. The product could also be used to promote tissue regeneration and repair. This sequence represents the human legless (49s) protein homologue higs-I described in the disclosure of the invention.

The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticidaes, therapeutics and pharmaceutical furugs. The invention discloses genomic DNA sequences (ABLIGIT6-ABL30511), expressed DNA sequences (ABL16175) and the encoded proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  (ABBS7737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Legless; fruitfly; 1gs; Mnt/Wingless signaling pathway; Wnt; Wg; tissue proliferation; tumour; cytostatic; cellular disorder; colon; blood disorder; cancer; hreast; head and neck cancer; brain; thyroid; medulloblastoma; skin cancer; tissue regeneration; tissue repair.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Fungicide, cytostatic, essential gene, Aspergillus fumigatus; infection, cancer, contamination, biofilm; antibody; immune response.
                                                                                                                                                                                                                                                     This invention describes a novel polypeptide sharing one or more homologous amino acid domains with the legless (19s) protein, a downstream component of the Witt/Wingless (Wit/Wg) signaling pathway involved in the formation and maintenance of spatial arrangements and proliferation of tissues during development, and in the formation and proliferation of tissues during development, and in the formation of provided many human tumours. The products of the invention have cytostatic activity and can be used to treat cellular disorders, blood disorders and cancerous condition is colon, breast, head and neck, brain, where the cancerous condition is colon, breast, head and neck, brain, thyroid, medulloblastoma or skin cancer. The product could also be used to promote tissue regeneration and repair. This sequence represents the prosphila melanogaster (fruitfly) legless (19s) protein described in
                                                                                                                                                                                               Novel polypeptide useful in therapeutic method for treating disorders of cell fate such as cell differentiation or cell proliferation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

The invention relates to novel purified or isolated nucleic acids of essential genes of Aspergillus fumigatus. The isolated nucleic acids of the invention are used to treat or prevent infections by a pathogenic organism such as A. fumigatus, to treat a non-infectious disease in a subject (e.g. cancer), to prevent or contain contamination of an object by A. fumigatus, or to prevent or inhibit formation on a surface of a blofilm comprising A. fumigatus or inhibit formation on a surface of a blofilm comprising A. fumigatus for host tissues in which the pathogenic expressing recombinant protein for characterisation, screening or therapeutic use, as markers for host tissues in which the pathogenic organisms invade or reside, for comparing with the DNA sequence of A. fumigatus to identify duplicated genes or paralogues having with DNA sequences of other related or distant pathogenic organisms to identify and/or incompanies. For selecting and making oligomers for attachment to a nucleic acid array for examination of expression patterns, for raising anti-DNA antibodies or to elicit annibodies, as an encompanies or the other repression contains an incoher incoher immune
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            response, and for identifying polynucleotides encoding the other protein with which binding occurs or to identify inhibitors of the binding interaction. The polypeptides may be used to raise antibodies or to elicit immune response, as a reagent in assays designed to quantitatively determine levels of the protein in biological fluids, as a marker for host tissues in which pathogenic organism invade or reside, and to isolate correlative receptors or ligands in the case or virulence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This sequence represents a protein of one of the essential genes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Fungicide; cytostatic; essential gene; Aspergillus fumigatus; infection; cancer; contamination; biofilm; antibody; immune response.
                                                                                                                                                                                                                                             New purified or isolated nucleic acids of essential genes of Aspergillus fumigatus, useful for treating or preventing infections by A. fumigatus, or for treating a non-infectious disease in a subject
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Ĥ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  host tissues in which pathogenic organism invade or reside, and to isolate correlative receptors or ligands in the case or virulence factors. This sequence represents a protein of one of the essential genes of Aspergillus fumigatus of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     elicit immune response, as a reagent in assays designed to quantitatively determine levels of the protein in biological fluids, as a marker for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        response, and for identifying polynucleotides encoding the other protein with which binding occurs or to identify inhibitors of the binding interaction. The polypeptides may be used to raise antibodies or to
                                                                                                                                                                                                                                                                                               essential genes of Aspergillus fundatus. The isolated nucleic acids of the invention are used to treat or prevent infections by a pathogenic organism such as A. fundatus, to treat a non-infectious disease in a subject (e.g. cancer), to prevent or contain contamination of an object by A. fundatus, or to prevent or inhibit formation on a surface of a biofilm comprising A. fundatus. The polynucleotides are useful for expressing recombinant protein for characterisation, screening or therapeutic use, as markers for host tissues in which the pathogenic organisms invade or reside, for comparing with the DNA sequence of A.
                                                                                                                                                                                                                                                                                                                                                                                                                                  funigatus to identify duplicated genes or paralogues having the same or similar biochemical activity and/or function, for comparing with DNA sequences of other related or distant pathogenic organisms to identify potential orthologous essential or virulence genes, for selecting and making oligomers for attachment to a nucleic acid array for examination of expression patterns, for raising anti-protein antibodies, as an
                                                                                                                                                                                          Aspergillus fumigatus, useful for treating or preventing infections by A. fumigatus, or for treating a non-infectious disease in a subject
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticidaes, therapeutics and pharmaceutical furges. The invention discloses genomic DNA sequences (ABL01840-ABL16175) and the encoded proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  (ABB57737-ABB72072).
The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                        New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human; primer; detection; diagnosis; antisense therapy; gene therapy.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     the specification. The primer sets can be used in antisense therapy and in gene therapy. The primers are useful for synthesising polynucleotides, particularly full-length converse the primers are also useful for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers allow obtaining of the full-length cDNAs easily without any specialised methods. AAH03166 to AAH13628 and AAH13633 to AAH13642 to AAH13632 represent human amino coid sequences; and AAH13629 to AAH13632 represent oligonucleotides, all of which are used in the exemplification
                                                                                                                                                                                                                              The present invention describes primer sets for synthesising 5602 full-length cDNAs defined in the specification. Where a primer set comprises: (a) an oligo-dT primer and an oligonucleotide complementary to the complementary strand of a polynucleotide which comprises one of injonucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprising a sequence complementary to the complementary strand of a polynucleotide which comprises a 5'-end sequence and an oligonucleotide comprising a sequence complementary to the polynucleotide which comprises a 3'-end sequence complementary to a polynucleotide which comprises a 3'-end sequence complementary to a bilgonucleotide which comprises a 1'-end sequence, where the oligonucleotide comprises a 1'-end sequence, and the combination of the 5'-end sequence, and sequence is selected from those defined in
                                                                             Primer sets for synthesizing polynucleotides, particularly the 5602 full-length cDNAs defined in the specification, and for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                0; Gaps

the expression level of a marker in a patient sample and the normal level of expression level of a marker in a patient sample and the normal level of expression level of a marker in a control non-ovarian cancer sample, where the marker is selected from 363 cancer markers described in the cancer is selected from 363 cancer markers described in the specification. The method of the invention is useful in diagnosing or characterising cancer, in detecting the presence of cancer as early as possible, and the recurrence of ovarian cancer. The method may also be of particular use with patients having a familial history of ovarian cancer (e.g. patients having a familial history of ovarian cancer.). The cancer markers may be used in the management and treatment of e.g. brain and central nervous system disorders (e.g. bacterial and disorders (e.g. bacterial or viral meningitis, batchemers (e.g. bacterial or viral meningitis), connective tissue disorders (e.g. nortuberculous granulomatous orchitis), connective tissue disorders, or heart disorders (e.g. ischaemic heart disorders (e.g. ischaemic heart disorders (e.g. ischaemic heart disorders (e.g. ischaemic cancer, monitoring the progression of ovarian cancer, connecting the ovarian cancer has metastasized or is likely to metastasize, selecting a composition for inhibiting ovarian cancer or at risk of developing ovarian cancer. The chibiting ovarian cancer or at risk of developing ovarian cancer markers described in the particular cancer or at risk of developing ovarian cancer markers
                                                                                                                                                                                                                                                                                                                               Assessing whether a patient is afflicted with ovarian cancer, useful in assessing the stage or progression of the disease, comprises comparing the expression level of a cancer marker in a sample from a patient and from a non cancer patient -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention relates to a new method for assessing whether a

A substantially purified GTPase activating protein useful for treating or preventing cell signalling, immune and cell proliferative disorders, including cancer especially colon cancer -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence represents a human GTPase activating protein, designated GTPAPI. GTPAP polynucleotides and polypeptides are useful for treating or preventing a disease or condition associated with altered expression of GTPase activating proteins, especially cell signalling, immune and cell proliferative disorders, including cancer especially colon cancer. Examples of diseases treatable include

Sequence 15, Application US/09651656
; Patent No. 6340516
; Patent No. 6340516
; Patent No. 6340516
; GENERAL INFORMATION:
; APPLICANT: IMCUTHEN-MALONEY, SANDRA
; APPLICANT: IMCUTHEN-MALONEY, SANDRA
; APPLICANT: IMCRENCE INTERMONE DETECTION AND QUANTITATION OF SINGLE NUCLEOTIDE
; TITLE OF INVENTION: DNA DAMAGE AND DNA MISMATCHES
; TITLE OF INVENTION: DNA DAMAGE AND DNA MISMATCHES
; FILE REFERENCE: 11-10689
; CURRENT APPLICATION NUMBER: US/09/651,656
; CURRENT FILING DATE: 2000-03-28
; PRIOR FILING DATE: 2000-03-28
; NUMBER OF SEQ ID NOS: 106
; SOFTWARE: PatentIn Ver. 2.1
; SEQ ID NOS: 106
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             GENERAL INFORMATION:

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                          Semialdehyde + NADP(+) + tRNA(Glu).
--- PATHWAY: Porphyrin biosynthesis by the C5 pathway; first step.
Involved in chlorophyll biosynthesis.
--- SIMILARITY: Belongs to the glutamyl-tRNA reductase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Pfam; PF00745; GlutR_dimer; 1.

                                                                                                                                                                                                                                                                                                                                                                                                FUNCTION: This protein is involved in the repair of mismatches in Now. It is possible that it carries out the mismatch recognition step. This protein has a weak ATPASE activity (By similarity). SIMILARITY: BELONGS TO THE DNA MISMATCH REPAIR MUTS FAMILY.

                                                                                                                                                                                                                                                                                                                                                                                                       MutS protein.";
Nucleic Acids Res. 26:4153-4159(1998).
--- FUNCTION: This protein is involved in the repair of mismatches in DNA. It is possible that it carries out the mismatch recognition step. This protein has a maximal ATPase activity at 80 degrees
                                                                                                                                                                                                                                         STRAIN=HB8 / ATCC 27634;

The Bacteriol. 184:2005-2018(2002).
The Puncrion: Responsible for the release of ribosomes from messenger RNA at the termination of protein biosynthesis. May increase the efficiency of translation by recycling ribosomes from one round of translation to another (By similarity).
The SUBCELLUIAR LOCATION: Cytoplasmic (By similarity).
The SUBCELLUIAR LOCATION: Cytoplasmic (By similarity).

-1- FUNCTION: REGULATORY PHOTORECEPTOR WHICH EXISTS IN TWO FORMS THAT ABOUND THE REVERSIBLY INTERCONVERTIBLE BY LIGHT: THE PR FORM THAT ABSORBS MAXIMALLY IN THE RED REGION OF THE SPECTRUM AND THE PER FORM THAT ABSORBS MAXIMALLY IN THE FAR-RED REGION. PHOTOCONVERSION OF PR IN PRE INDUCES AN ARRAY OF WORPHOGENIC RESPONSES, WHEREAS RECONVERSION OF PFR TO PR CANCELS THE INDUCTION OF THOSE RESPONSES. PRE CONTROLS THE EXPRESSION OF A NUMBER OF NUCLEAR GENES INCLUDING THOSE ENCODING THE SMALL SUBUNIT OF RIBULOSE-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       BISPHOSPHATE CARBOXYLASE, CHLOROPHYLL A/B BINDING PROTEIN, PROTOCHLOROPHYLLIDE REDUCTASE, RRNA, ETC. FIT Cyanobacterium Anabaena sp. strain PCC 7120.";

KIE, DAN Res. 88 205-213(2001).

- 1- FUNCTION: THE SIGNA FACTOR IS AN INITIATION FACTOR THAT PROMOTES

CT ATTACHEMENT OF THE RNA POLYMERASE TO SPECIFIC INITIATION SITES AND

THEN IS RELEASED.

- 1- SIMILARITY: Belongs to the sigma-70 factor family.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                  830525
